COMPUTER VISION EVENT

# **Introduction:**

Set in a modified version of the middle earth world, hobbit Frodo Baggins and the Fellowship embark on a quest to destroy not one but multiple Rings, to ensure the destruction of the Dark Lord Sauron. Help Frodo navigate through the path of the green rings in order to destroy them and counter the obstacles present to deviate them from their path to win the War of the Rings by weakening Sauron's forces.

## **Problem Statement:**

To build a robot that uses an onboard camera to detect a path formed by circles and traverses on it autonomously and is capable of shape detection and barcode reading.

## **USP:**

- Colour Detection
- Obstacle Avoidance
- Pattern Detection
- Onboard camera

# Rules

## General Rules:

- The maximum number of participants allowed per team: 4 people
- The participants will be provided with 220 Volts, 50 Hz standard AC supply.
- Participants will have to arrange for themselves, if they require, any other power supply for their robot.
- Onboard processing units, if any, should fit within the dimensional constraints specified. Processing outside the arena is recommended, either wired or wireless.
- Teams qualifying the first round will go into the second round.
- Teams cannot tinker with their robots inside the arena.
- USB extenders (5m long) will be provided.
- The decision of Team Robotix will be final and binding.
- If we suspect hard coding, we reserve the full right to check the participant's robot by testing on random arenas and code submission.
- Any team displaying aggressive behaviour or refusing to comply with the judgement of Team Robotix will be immediately disqualified.
- Wilful damage of the arena may lead to disqualification and a fine.

## Event Rules:

- The robot must remain within the arena throughout the run.

- Maximum Restarts:
  - Round 1: **1**
  - Round 2: **1**
- Maximum Timeouts:
  - Round 1: **2**
  - Round 2: **2**
  - The maximum duration of a timeout is **2 mins** only.
- Restarts will be given only for technical fault in the robot.
- Thresholding time of **20 minutes** will be given in each round before the run starts.
- The robot must begin and end its run at the **START ZONE** and the **END ZONE** respectively marked in the arena.

## Robot Specifications:

- The robot must fit in a box of **20cm x 20cm x 20cm** with a tolerance of **10%** in the dimensions of the robot. No part/mechanism of/on the robot should exceed the given dimensions before the commencement of the event. However, the dimensions can change during the run.
- Dimensions of the arena are to be considered with a maximum tolerance of **10%**.
- Onboard camera for the runs will be provided by TEAM Robotix. The model of the webcam used is:  
<https://www.logitech.com/en-us/product/hd-pro-webcam-c920s>

# TASK

## The Barcode:

- The barcode consists of 4 white strips which are either thin (10mm wide) or thick (20 mm wide) separated by black tape
- Reading from left to right, each white strip corresponds to 1-bit which is either a 0 or 1. A thick strip corresponds to a 1 and a thin strip corresponds to a 0.
- The total width of the barcode is always 100mm. Further, the barcode is surrounded by a 1cm thick black boundary around it.
- The barcode can represent binary numbers from 0000 to 1111 (which correspond to 0-15 in decimal number system).

## Round 1:

- The arena consists of 2-D **green circles** and 2D non-green **triangles and quadrilaterals**. The circle will be of **7cm diameter** with an approximately equal **15cm distance** between the centres of consecutive circles.
- The robot makes must move from the start point to the endpoint moving along the circles. It must move through each circle without straying from the path. The path is defined by always following the next **closest circle**.
- The path **branches** after each 2D obstacle which can be either a triangle or a quadrilateral based on which, the bot must decide which direction to proceed in- right or left. The directions can be **different** for different runs.
- For example, if it's a triangle, the bot must proceed towards the left and towards right if it's a quadrilateral. It also must blink an LED once if it's a triangle and twice if it's a quadrilateral obstacle.

## Round 2:

- In the second round, the distance between the circles will **vary** and not remain uniform. Further, obstacles, which will only be quadrilaterals, will contain a **barcode** that the bot must read.
- The paths branching from each of these obstacles will be of different colors. Depending on the information scanned, if the path to be followed is green, the bot must blink an LED once, twice if it is blue and thrice if it is red.
- The number of times corresponding to a colour may change for different runs. Then it must scan the paths and either turn right, left or keep moving forward. For example:

| NUMBER ON NODE     | PATH TO BE CHOSEN |
|--------------------|-------------------|
| 0, 3, 6, 9, 12, 15 | Green path        |
| 1, 4, 7, 10, 13    | Red path          |
| 2, 5, 8, 11, 14    | Blue path         |

- However, colour of path to be chosen may change for different runs.
- The last node will be a plain black square. Taking the average of the numbers scanned so far, it must either turn right, left or move forward.

| AVERAGE | TURN    |
|---------|---------|
| 0-5     | FORWARD |
| 6-10    | RIGHT   |
| 11-15   | LEFT    |

# Scoring

## Round 1:

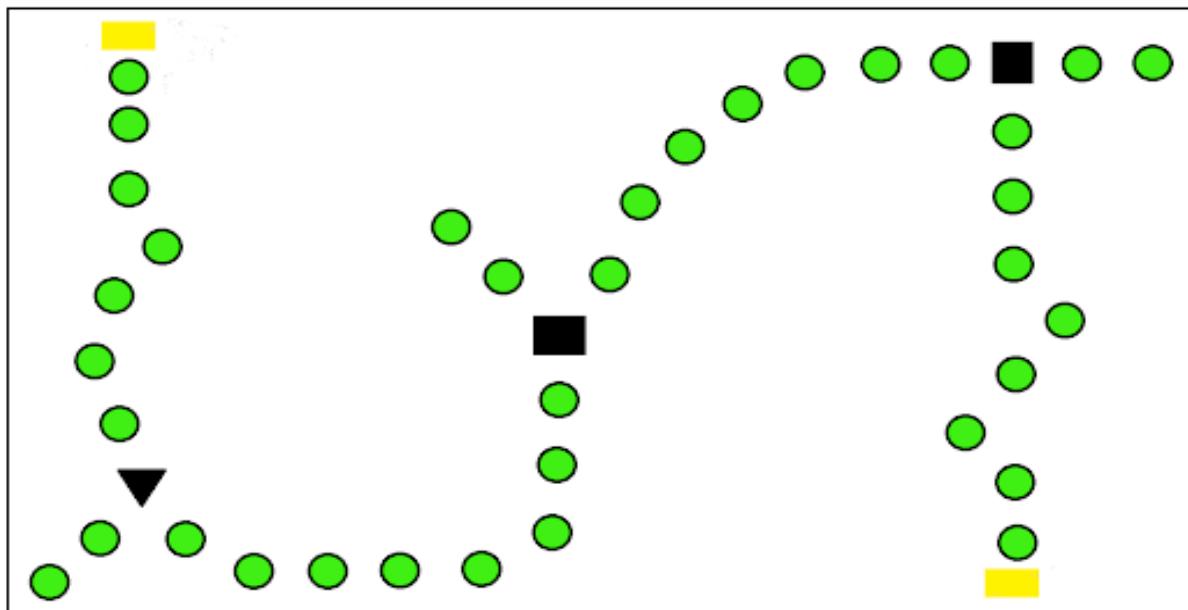

- Moving to the next closest circle; landing on the circle: **+20 points**
- Detecting the shape of the obstacle by correctly blinking LED: **+100 points**
- Correct path identification after obstacle encounter: **+100 points**
- Time Bonus: **+300 - Time taken (in s)**
- Not moving to the next closest circle: **-10 points**
- Incorrect shape detection of obstacle: **-50 points**
- Incorrect turn after obstacle encounter: **-100 points**
- Slipping out of the line (based on Team Robotix discretion): **-50 points**
- Restart: **-100 points**
- Timeout: **-50 points**

## Round 2:

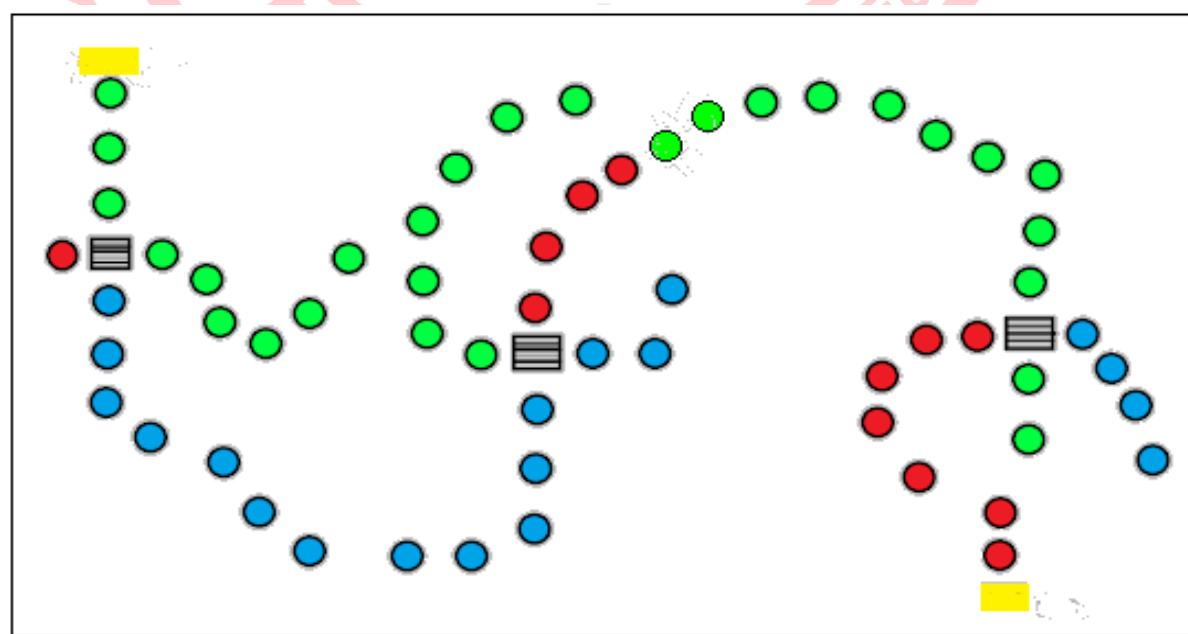

- Moving to the next closest circle: Landing on the circle: **+20 points**
- Correct identification of path color after reading the barcode: **+100 points**
- Correctly choosing the path after barcode reading: **+200 points**
- Correct turn identification after yellow node: **+150 points**
- Time Bonus = **+300 - Time Taken (in s)**
- Not moving to the next closest circle: **-10 points**
- Incorrect identification of the path color from the barcode: **-50 points**
- Incorrectly identifying turn from the barcode: **-50 points**
- Incorrect turn after black node: **-100 points**
- Slipping out of the line (based on Team Robotix discretion): **-50 points**
- Restart: **-100 points**
- Timeout: **-50 points**

# ARENA

## Round 1:

## Round 2:

# SAMPLE SCORING

**Case 1: (Round 1)** Robot correctly traverses all circles, making correct turns at the obstacles.

Let's say there are 30 circles in the shortest path and 3 obstacles (triangle or rectangle). The bot lands on each circle and correctly identifies the correct shapes and paths with 30 seconds left, the corresponding scoring will be:

- $+30 \times 20 = 600$  points for landing on each circle.
- $+3 \times 100 = 300$  points for correctly identifying shape by blinking LED.
- $+3 \times 100 = 300$  points for choosing the correct path.
- $+(300-270) = 30$  points as time bonus

Hence, the final tally will be **1230 points**.

**Case 2: (Round 1)** The robot lands on 20 circles, making correct turns at 1 of the 3 obstacles, correctly identifying the shapes at 2 of the 3 obstacles and slips out of path one time.

Let's say that 15 of the 20 circles are the next closest ones in the path and there is exactly no time left. The scoring will be:

- $+15 \times 20 = 300$  points for landing on each circle.
- $-5 \times 10 = -50$  points for correctly identifying shape by blinking LED.
- $+1 \times 100 = 100$  points for choosing the correct path.
- $-2 \times 100 = -200$  points for choosing the incorrect paths.
- $+2 \times 100 = 200$  points for correctly identifying the shapes by blinking LED.

- $-1 \times 50 = -50$  points for incorrectly identifying one of the shapes.
- $-1 \times 50 = -50$  points for slipping out of the line.
- $+(300-300) = 0$  points as time bonus.

**Hence, the final tally will be 300 points.**

**Case 3: (Round 2)** The robot lands on 25 circles, making correct turns at 3 of the 3 barcodes, correctly identifying the path colour at 2 of the 3 barcodes. The robot also makes the correct turn at the final node.

Let's say that 23 of the 25 circles are the next closest ones in the path and 20 seconds more than permitted. The scoring will be:

- $+23 \times 20 = 460$  points for landing on each circle.
- $-2 \times 10 = -20$  points for correctly identifying shape by blinking LED.
- $+3 \times 200 = 600$  points for choosing the correct path.
- $+2 \times 100 = 200$  points for correctly identifying the path colours by blinking LED.
- $-1 \times 50 = -50$  points for incorrect path colour detection.
- $+1 \times 50 = 150$  points for correct turn at final node.
- $+(300-320) = -20$  points as time bonus

**Hence, the final tally will be 1320 points.**
